the transfer to the prince of the natural right possessed by of others? Or should it be regarded as a specific right that was an "indirect" power over them of life and death.1 But if this way, the power of life and death was not an absolute and his own survival. Must we follow Hobbes in seeing it as every individual to defend his life even if this meant the death as punishment, the latter would be put to death. Viewed in manifested with the formation of that new juridical being, of the state; without "directly proposing their death," he was then he could exercise a direct power over the offender's life: privilege: it was conditioned by the defense of the sovereign, wage war, and require his subjects to take part in the defense empowered to "expose their life": in this sense, he wielded someone dared to rise up against him and transgress his laws, conditional way, but only in cases where the sovereign's very existence was in jeopardy: a sort of right of rejoinder. If he throw him or contest his rights, he could then legitimately It was no longer considered that this power of the sovereign over his subjects could be exercised in an absolute and unwere threatened by external enemies who sought to over-For a long time, one of the characteristic privileges of sovereign power was the right to decide life and death. In a formal sense, it derived no doubt from the ancient patria potestas that granted the father of the Roman family the just as he had given them life, so he could take it away. By cal theoreticians, it was in a considerably diminished form. right to "dispose" of the life of his children and his slaves; the time the right of life and death was framed by the classi-Samuel von Pufendorf, Le Droit de la nature (French trans., 1734), p. 445.

the sovereign?2 In any case, in its modern form—relative and limited-as in its ancient and absolute form, the right of life and death is a dissymmetrical one. The sovereign exercised his right of life only by exercising his right to kill, or by refraining from killing; he evidenced his power over life only through the death he was capable of requiring. The right which was formulated as the "power of life and death" was in reality the right to take life or let live. Its symbol, after all, was the sword. Perhaps this juridical form must be referred to a historical type of society in which power was exercised mainly as a means of deduction (prélèvement), a subtraction mechanism, a right to appropriate a portion of the wealth, a tax of products, goods and services, labor and blood, levied on the subjects. Power in this instance was essentially a right of seizure: of things, time, bodies, and ultimately life itself; it culminated in the privilege to seize hold of life in order to suppress it.

Since the classical age the West has undergone a very profound transformation of these mechanisms of power. "Deduction" has tended to be no longer the major form of power but merely one element among others, working to incite, reinforce, control, monitor, optimize, and organize the forces under it: a power bent on generating forces, making them grow, and ordering them, rather than one dedicated to impeding them, making them submit, or destroying them. There has been a parallel shift in the right of death, or at least a tendency to align itself with the exigencies of a life-administering power and to define itself accordingly. This death that was based on the right of the sovereign is now manifested as simply the reverse of the right of the social body to ensure, maintain, or develop its life. Yet wars were never as bloody as they have been since the nineteenth century, and all things

being equal, never before did regimes visit such holocausts on their own populations. But this formidable power of death —and this is perhaps what accounts for part of its force and the cynicism with which it has so greatly expanded its limits -now presents itself as the counterpart of a power that exerts a positive influence on life, that endeavors to administer, optimize, and multiply it, subjecting it to precise controls and comprehensive regulations. Wars are no longer waged in the name of a sovereign who must be defended; they are waged on behalf of the existence of everyone; entire populations are mobilized for the purpose of wholesale slaughter in the name of life necessity: massacres have become vital. It is as managers of life and survival, of bodies and the race, that so many regimes have been able to wage so many wars, causing so many men to be killed. And through a turn that closes the circle, as the technology of wars has caused them to tend increasingly toward all-out destruction, the decision that initiates them and the one that terminates them are in fact increasingly informed by the naked question of survival. The atomic situation is now at the end point of this process: the power to expose a whole population to death is the underside of the power to guarantee an individual's continued existence. The principle underlying the tactics of battle—that one has to be capable of killing in order to go on Tiving—has become the principle that defines the strategy of states. But the existence in question is no longer the juridical existence of sovereignty; at stake is the biological existence of a population. If genocide is indeed the dream of modern powers, this is not because of a recent return of the ancient right to kill; it is because power is situated and exercised at the level of life, the species, the race, and the large-scale phenomena of population.

On another level, I might have taken up the example of the death penalty. Together with war, it was for a long time the other form of the right of the sword; it constituted the reply of the sovereign to those who attacked his will, his law, or

² "Just as a composite body can have properties not found in any of the simple bodies of which the mixture consists, so a moral body, by virtue of the very union of persons of which it is composed, can have certain rights which none of the individuals could expressly claim and whose exercise is the proper function of leaders alone." Pufendorf, Le Droit de la nature, p. 452.

nis person. Those who died on the scaffold became fewer and 'ewer, in contrast to those who died in wars. But it was for he same reasons that the latter became more numerous and he former more and more rare. As soon as power gave itself he function of administering life, its reason for being and the ogic of its exercise—and not the awakening of humanitarian eelings-made it more and more difficult to apply the death penalty. How could power exercise its highest prerogatives by putting people to death, when its main role was to ensure. ustain, and multiply life, to put this life in order? For such power, execution was at the same time a limit, a scandal, ınd a contradiction. Hence capital punishment could not be naintained except by invoking less the enormity of the crime tself than the monstrosity of the criminal, his incorrigibility, ind the safeguard of society. One had the right to kill those vho represented a kind of biological danger to others.

One might say that the ancient right to take life or let live vas replaced by a power to foster life or disallow it to the point of death. This is perhaps what explains that disqualifiation of death which marks the recent wane of the rituals hat accompanied it. That death is so carefully evaded is inked less to a new anxiety which makes death unbearable or our societies than to the fact that the procedures of power lave not ceased to turn away from death. In the passage from his world to the other, death was the manner in which a errestrial sovereignty was relieved by another, singularly nore powerful sovereignty; the pageantry that surrounded it vas in the category of political ceremony. Now it is over life, hroughout its unfolding, that power establishes its dominon; death is power's limit, the moment that escapes it; death ecomes the most secret aspect of existence, the most "priate." It is not surprising that suicide—once a crime, since was a way to usurp the power of death which the sovereign lone, whether the one here below or the Lord above, had the ight to exercise—became, in the course of the nineteenth entury, one of the first conducts to enter into the sphere of

sociological analysis; it testified to the individual and private right to die, at the borders and in the interstices of power that was exercised over life. This determination to die, strange and yet so persistent and constant in its manifestations, and consequently so difficult to explain as being due to particular circumstances or individual accidents, was one of the first astonishments of a society in which political power had assigned itself the task of administering life.

In concrete terms, starting in the seventeenth century, this power over life evolved in two basic forms; these forms were not antithetical, however; they constituted rather two poles of development linked together by a whole intermediary cluster of relations. One of these poles—the first to be formed, it seems—centered on the body as a machine: its IT disciplining, the optimization of its capabilities, the extortion of its forces, the parallel increase of its usefulness and its docility, its integration into systems of efficient and economic controls, all this was ensured by the procedures of power that characterized the disciplines: an anatomo-politics of the human body. The second, formed somewhat later, focused on the species body, the body imbued with the mechanics of life and serving as the basis of the biological processes: propagation, births and mortality, the level of health, life expectancy and longevity, with all the conditions that can cause these to vary. Their supervision was effected through an entire series of interventions and regulatory controls: a biopolitics of the population. The disciplines of the body and the regulations of the population constituted the two poles around which the organization of power over life was deployed. The setting up, in the course of the classical age, of this great bipolar technology—anatomic and biological, individualizing and specifying, directed toward the performances of the body, with attention to the processes of lifecharacterized a power whose highest function was perhaps no longer to kill, but to invest life through and through.

The old power of death that symbolized sovereign power

was now carefully supplanted by the administration of bodies and the calculated management of life. During the classical period, there was a rapid development of various disciplines —universities, secondary schools, barracks, workshops: there was also the emergence, in the field of political practices and economic observation, of the problems of birthrate. longevity, public health, housing, and migration. Hence there was an explosion of numerous and diverse techniques for achieving the subjugation of bodies and the control of populations, marking the beginning of an era of "biopower." The two directions taken by its development still appeared to be clearly separate in the eighteenth century. With regard to discipline, this development was embodied in institutions such as the army and the schools, and in reflections on tactics, apprenticeship, education, and the nature of societies, ranging from the strictly military analyses of Marshal de Saxe to the political reveries of Guibert or Servan. As for population controls, one notes the emergence of demography, the evaluation of the relationship between resources and inhabitants, the constructing of tables analyzing wealth' and its circulation: the work of Quesnay, Moheau, and Süssmilch. The philosophy of the "Ideologists," as a theory of ideas, signs, and the individual genesis of sensations, but also a theory of the social composition of interests—Ideology being a doctrine of apprenticeship, but also a doctrine of contracts and the regulated formation of the social body no doubt constituted the abstract discourse in which one sought to coordinate these two techniques of power in order to construct a general theory of it. In point of fact, however, they were not to be joined at the level of a speculative discourse, but in the form of concrete arrangements (agencements concrets) that would go to make up the great technology of power in the nineteenth century: the deployment of sexuality would be one of them, and one of the most important.

This bio-power was without question an indispensable ele-

ment in the development of capitalism; the latter would not have been possible without the controlled insertion of bodies into the machinery of production and the adjustment of the phenomena of population to economic processes. But this was not all it required; it also needed the growth of both these factors, their reinforcement as well as their availability and docility; it had to have methods of power capable of optimizing forces, aptitudes, and life in general without at the same time making them more difficult to govern. If the development of the great instruments of the state, as institutions of power, ensured the maintenance of production relations, the rudiments of anatomo- and bio-politics, created in the eighteenth century as techniques of power present at every level of the social body and utilized by very diverse institutions (the family and the army, schools and the police, individual medicine and the administration of collective bodies), operated in the sphere of economic processes, their development, and the forces working to sustain them. They also acted as factors of segregation and social hierarchization, exerting their influence on the respective forces of both these movements, guaranteeing relations of domination and effects of hegemony. The adjustment of the accumulation of men to that of capital, the joining of the growth of human groups to the expansion of productive forces and the differential allocation of profit, were made possible in part by the exercise of bio-power in its many forms and modes of application. The investment of the body, its valorization, and the distributive management of its forces were at the time indispensable.

One knows how many times the question has been raised concerning the role of an ascetic morality in the first formation of capitalism; but what occurred in the eighteenth century in some Western countries, an event bound up with the development of capitalism, was a different phenomenon having perhaps a wider impact than the new morality; this was nothing less than the entry of life into history, that is, the entry of phenomena peculiar to the life of the human species

as a living being in question. dealing simply with legal subjects over whom the ultimate from time to time, amid the randomness of death and its power's sphere of intervention. Power would no longer be existence was reflected in political existence; the fact of living was no longer an inaccessible substrate that only emerged fatality; part of it passed into knowledge's field of control and ment of the different fields of knowledge concerned with life and modify them. Western man was gradually learning what it meant to be a living species in a living world, to have a riod of great ravages from starvation and plague had come to a close before the French Revolution; death was ceasing in general, the improvement of agricultural techniques, and the observations and measures relative to man's life and survival contributed to this relaxation: a relative control over life averted some of the imminent risks of death. In the space for movement thus conquered, and broadening and organizing that space, methods of power and knowledge assumed responsibility for the life processes and undertook to control body, conditions of existence, probabilities of life, an individual and collective welfare, forces that could be modified, and a space in which they could be distributed in an optimal manner. For the first time in history, no doubt, biological opment of the eighteenth century, and an increase in productivity and resources even more rapid than the demographic growth it encouraged, allowed a measure of relief from these to torment life so directly. But at the same time, the developtwo great dramatic forms of this relationship that was always dominated by the menace of death. But through a circular profound threats: despite some renewed outbreaks, the peinto the order of knowledge and power, into the sphere of bolitical techniques. It is not a question of claiming that this was the moment when the first contact between life and nistory was brought about. On the contrary, the pressure strong for thousands of years; epidemics and famine were the process, the economic—and primarily agricultural—develexerted by the biological on the historical had remained very

perhaps greater, and certainly more serious, than before the "threshold of modernity" has been reached when the life of milfennia, man remained what he was for Aristotle: a living modern man is an animal whose politics places his existence Outside the Western world, famine exists, on a greater scale than ever; and the biological risks confronting the species are birth of microbiology. But what might be called a society's animal with the additional capacity for a political existence; mechanisms into the realm of explicit calculations and made It is not that lite has been totally integrated into techniques the species is wagered on its own political strategies. For applied at the level of life itself; it was the taking charge of even to the body. If one can apply the term bio-history to the esses of history interfere with one another, one would have to speak of bio-power to designate what brought life and its that govern and administer it; it constantly escapes them. it would be able to exercise over them would have to be life, more than the threat of death, that gave power its access knowledge-power an agent of transformation of human life. dominion was death, but with living beings, and the mastery pressures through which the movements of life and the proc-

teme. If the question of man was raised-insofar as he was beings-the reason for this is to be sought in the new mode of relation between history and life: in this dual position of life that placed it at the same time outside history, in its biological environment, and inside human historicity, penetrated by the latter's techniques of knowledge and power. There is no need either to lay further stress on the proliferaoccurred then in the pattern of scientific discourse and on the disrupted and redistributed the order of the classical episa specific living being, and specifically related to other living tion of political technologies that ensued, investing the body, would serve no purpose here to dwell on the rupture that This transformation had considerable consequences. It manner in which the twofold problematic of life and man

health, modes of subsistence and habitation, living conditions, the whole space of existence.

Another consequence of this development of bio-power was the growing importance assumed by the action of the norm, at the expense of the juridical system of the law. Law cannot help but but be armed, and its arm, par excellence, is death; to those who transgress it, it replies, at least as a last resort, with that absolute menace. The law always refers to the sword. But a power whose task is to take charge of life needs continuous regulatory and corrective mechanisms. It is no longer a matter of bringing death into play in the field of sovereignty, but of distributing the living in the domain of value and utility. Such a power has to qualify, measure, appraise, and hierarchize, rather than display itself in its murderous splendor; it does not have to draw the line that separates the enemies of the sovereign from his obedient subjects; it effects distributions around the norm. I do not mean to say that the law fades into the background or that the institutions of justice tend to disappear, but rather that the law operates more and more as a norm, and that the judicial institution is increasingly incorporated into a continuum of apparatuses (medical, administrative, and so on) whose functions are for the most part regulatory. A normalizing society is the historical outcome of a technology of power centered on life. We have entered a phase of juridical regression in comparison with the pre-seventeenth-century societies we are acquainted with; we should not be deceived by all the Constitutions framed throughout the world since the French Revolution, the Codes written and revised, a whole continual and clamorous legislative activity: these were the forms that made an essentially normalizing power acceptable.

Moreover, against this power that was still new in the nineteenth century, the forces that resisted relied for support on the very thing it invested, that is, on life and man as a living being. Since the last century, the great struggles that

have challenged the general system of power were not guided by the belief in a return to former rights, or by the age-old dream of a cycle of time or a Golden Age. One no longer aspired toward the coming of the emperor of the poor, or the kingdom of the latter days, or even the restoration of our imagined ancestral rights; what was demanded and what served as an objective was life, understood as the basic needs, man's concrete essence, the realization of his potential, a plenitude of the possible. Whether or not it was Utopia that was wanted is of little importance; what we have seen has been a very real process of struggle; life as a political object was in a sense taken at face value and turned back against the system that was bent on controlling it. It was life more than the law that became the issue of political struggles, even if the latter were formulated through affirmations concerning rights. The "right" to life, to one's body, to health, to happiness, to the satisfaction of needs, and beyond all the oppressions or "alienations," the "right" to rediscover what one is and all that one can be, this "right"—which the classical juridical system was utterly incapable of comprehending was the political response to all these new procedures of power which did not derive, either, from the traditional right of sovereignty.

This is the background that enables us to understand the importance assumed by sex as a political issue. It was at the pivot of the two axes along which developed the entire political technology of life. On the one hand it was tied to the disciplines of the body: the harnessing, intensification, and distribution of forces, the adjustment and economy of energies. On the other hand, it was applied to the regulation of populations, through all the far-reaching effects of its activity. It fitted in both categories at once, giving rise to infinitesimal surveillances, permanent controls, extremely meticulous orderings of space, indeterminate medical or psychological examinations, to an entire micro-power concerned with the

body. But it gave rise as well to comprehensive measures, statistical assessments, and interventions aimed at the entire of access both to the life of the body and the life of the social body or at groups taken as a whole. Sex was a means species. It was employed as a standard for the disciplines and century sexuality was sought out in the smallest details of individual existences; it was tracked down in behavior, puras a basis for regulations. This is why in the nineteenth sued in dreams; it was suspected of underlying the least follies, it was traced back into the earliest years of childhood; it became the stamp of individuality—at the same time what enabled one to analyze the latter and what made it possible to master it. But one also sees it becoming the theme of political operations, economic interventions (through incitements to or curbs on procreation), and ideological campaigns put forward as the index of a society's strength, revealing of for raising standards of morality and responsibility: it was both its political energy and its biological vigor. Spread out from one pole to the other of this technology of sex was a whole series of different tactics that combined in varying proportions the objective of disciplining the body and that of regulating populations.

Whence the importance of the four great lines of attack along which the politics of sex advanced for two centuries. Each one was a way of combining disciplinary techniques with regulative methods. The first two rested on the requiredescent, and collective welfare, in order to obtain results at the level of discipline; the sexualization of children was accomplished in the form of a campaign for the health of the race (precocious sexuality was presented from the eighteenth century to the end of the nineteenth as an epidemic menace but the future of the entire society and species); the hysterization of women, which involved a thorough medicalization of their bodies and their sex, was carried out in the name of the

Right of Death and Power over Life

responsibility they owed to the health of their children, the solidity of the family institution, and the safeguarding of society. It was the reverse relationship that applied in the case of birth controls and the psychiatrization of perversions: here the intervention was regulatory in nature, but it had to rely on the demand for individual disciplines and constraints (dressages). Broadly speaking, at the juncture of the "body" and the "population," sex became a crucial target of a power organized around the management of life rather than the menace of death.

The blood relation long remained an important element in castes, and the value of descent lines were predominant; for the mechanisms of power, its manifestations, and its rituals. For a society in which the systems of alliance, the political form of the sovereign, the differentiation into orders and a society in which famine, epidemics, and violence made death imminent, blood constituted one of the fundamental values. It owed its high value at the same time to its instrutioned in the order of signs (to have a certain blood, to be of mental role (the ability to shed blood), to the way it functhe same blood, to be prepared to risk one's blood), and also to its precariousness (easily spilled, subject to drying up, too readily mixed, capable of being quickly corrupted). A society of blood-I was tempted to say, of "sanguinity"-where power spoke through blood: the honor of war, the fear of executioners, and tortures; blood was a reality with a symbolic function. We, on the other hand, are in a society of "sex," or rather a society "with a sexuality": the mechanisms famine, the triumph of death, the sovereign with his sword, of power are addressed to the body, to life, to what causes it to proliferate, to what reinforces the species, its stamina, its ability to dominate, or its capacity for being used. Through the themes of health, progeny, race, the future of sexuality and to sexuality; the latter was not a mark or a the species, the vitality of the social body, power spoke of symbol, it was an object and a target. Moreover, its impor-
